Technical Skills

LANGUAGES: Java, Python, SQL, JavaScript, C++, C

TOOLS: Docker, Kubernetes, AWS, SumoLogic, Azure

FRAMEWORKS/LIBRARIES: Spring, OpenSearch, maven, Lombok, junit, Mockito, Testcontainer, Selenium, Godot

Experience

Jostle Corporation - *Backend Java Developer*

JUNE 2022 - MAY 2025

Collaborated with the product owner, design team, and frontend developers to plan and deliver features and improvements for the Jostle SaaS web platform in an Agile environment.

- Implemented a filterable in-platform search engine using Opensearch k-NN indexing to allow users to search for internal documents, resulting in 200% faster results
- Designed and developed a live custom analytics page to display Opensearch usage numbers, allowing for easier data analysis and administrative operations
- Optimized calls to Opensearch API to drastically improve run times by 5000% when viewing filtered live data by implementing a staggered expiration cache
- Deployed and maintained multiple instances and configurations of Opensearch and related microservices for each regional server via Docker and AWS
- Researched and prototyped plausibility, costs, and benefits of an AI search feature
- Created a framework for easier creation of customizable CSVs using data from SQL Views
- Updated previous external integrations to adhere to new API security standards
- Migrated data of active customers to S3 to eliminate platform errors stemming from Sharefile through a multistep mirroring process to ensure zero downtime
- Wrote custom testing software to test microservices within containers, which allowed for localized and remote regression testing of version compatibility via Gitlab
- Maintained >95% CI test coverage on written code to ensure quality and stability
- Resolved bugs and anomalies found in the live application within a release of discovery
- Improved developer workflow by streamlining dev environment setup (consisting of creating docker containers for each microservice and variable setup required for connection to AWS and other services) via Shell scripts to reduce initial setup times from an average of 7 days to 2 days

Freelance - *Web Developer*

SEPTEMBER 2021 - JUNE 2022

- Created multiple personalized e-commerce websites for clients from scratch with JavaScript, Shopify, and WordPress
- Handled payments securely using Stripe API

- Designed and wrote custom ordering interface to allow for prescription glasses sales
- Automatically pulled social media posts using Twitter and Instagram APIs to display
- Maintained website frontend and backend for more responsive loading times and interactions

Jostle Corporation – *Junior Java Developer*

SEPTEMBER 2019 - AUGUST 2020

- Securely integrated Slack and Microsoft Teams APIs with existing Jostle platform
- Researched and proposed said integrations with implementation plans
- Created a bot using Microsoft Azure to handle integration with Microsoft Teams API
- Documented entire integration processes for easier debugging and hand-off
- Optimized internal microservices and large code base for enhanced performance
- Coded using the MVC pattern and followed the Kanban development workflow method
- Mentored and on-boarded new interns and provided tech support for customer support
- Wrote automated integration and unit tests for use on simulated production environments
- Analyzed logs from SumoLogic to debug issues in test and production releases
- Performed and received code reviews to ensure best coding practices
- Self-sufficiently worked in-office and remotely

Personal Projects

Magic-based Farming RPG

AUGUST 2021 - MAY 2022, MAY 2025 - PRESENT

- 2D grid-based world allowing for state-based actions, custom terrain with variable properties, positional targeting, and a simple AI using heat maps to calculate NPC and enemy movements and actions
- Coded different interactions for magic depending on environment (Offensive magic when enemies are present, otherwise use magic to help with farming tasks such as tilling the earth, watering the crops, and harvesting)
- Researched different engines that would be best suited (Unity, Unreal, Godot, etc)

Staff Sign-In Application

FEBRUARY 2019 – SEPTEMBER 2019

- Android and PC application using an SQL database for tracking staff sign-in/attendance
- Verified staff's unique barcode via Google Barcode Scanner
- Gamified using a point system based on punctuality with a leaderboard and special effects upon sign-in actions

Education

Simon Fraser University, Burnaby, BC

Bachelor of Computing Science
