

Youssef EL Khammal — Bilingual Cloud & DevOps Engineer

Vancouver, BC • +1 (672) 699-3289 • youssef.elkhammal.cv@gmail.com • linkedin.com/in/youssef-el-khammal

PROFESSIONAL SUMMARY

Bilingual (English/French) Cloud & DevOps Engineer with 3 years of experience building CI/CD pipelines, Kubernetes platforms, and cloud infrastructure for global retail and eCommerce clients such as Chanel and Nestlé. Delivered secure, scalable systems by driving IaC automation, strengthening container security, and optimizing cloud costs. Skilled in Azure automation (Runbooks, Terraform, YAML) and end-to-end delivery—from infrastructure design to production operations and incident response.

EDUCATION

- Engineering Degree in Computer Science — ENSA Fès University, Morocco (2019–2022)
- **WES Evaluation: Canadian equivalency to Bachelor's and Master's degree**

CERTIFICATIONS

- *Certified Kubernetes Administrator (CKA)* — The Linux Foundation
- *Preparing for Microsoft Certified: Azure Administrator (AZ-104)*
- *IELTS (English)*
- *TCF (French)*

KEY TECHNOLOGIES

Cloud: Microsoft Azure(Azure Runbooks, Synapse Analytics, Data Lake), AWS (EC2, EKS, IAM, S3, VPC), GCP

CI/CD Tools: GitLab CI/CD, Jenkins, Azure DevOps

Containers & Orchestration: Docker, Kubernetes, Rancher, Helm

Infrastructure as Code & Configuration Management: Terraform, Bicep, ARM templates, Ansible, Chef

Scripting & Automation: Bash, PowerShell, Python, SQL, YAML

Virtualization: VMware, Hyper-V, ESXi

Version Control: Git, GitHub, GitLab

Monitoring & ITSM: Datadog, ServiceNow, SolarWinds (exposure)

Operating Systems: Linux (RHEL, CentOS, Ubuntu), UNIX, Windows

PROFESSIONAL EXPERIENCE

Cloud & DevOps Engineer — SQLI, Rabat, Morocco

Sept 2022 – Feb 2025

SQLI is a leading European and international digital services and consulting group, specialized in eCommerce, cloud, and digital transformation, partnering with major global brands to deliver innovative and high-impact technology solutions. I delivered cloud and DevOps solutions for enterprise eCommerce clients such as Chanel and Nestlé—designing cloud infrastructures on Azure and AWS, automating CI/CD pipelines, and containerizing applications on Kubernetes to support high-traffic, globally distributed platforms.

Key Contributions

- Rebuilt fragmented CI/CD flows into modular YAML pipelines (GitLab CI, Jenkins, Azure DevOps), cutting manual intervention and reducing deployment failures.
- Wrote Terraform + Bicep templates to provision Azure environments (dev/test/prod), ensuring consistency and faster team onboarding.
- Deployed microservices to Rancher-managed Kubernetes clusters, implementing autoscaling, probes, and upgrade strategies for zero-downtime releases.

- Integrated Harbor registry and Trivy security scanning into pipelines, enforcing compliance and reducing vulnerable container releases.
- Implemented monitoring and alerting for cloud services, enabling faster response to outages.
- Automated non-prod shutdowns and resource rightsizing, cutting unnecessary cloud costs.
- Resolved recurring SAP Hybris deployment failures by rewriting an outdated Bash rollout script and designing a more reliable strategy — improved release success rate and reduced rollback effort.
- Contributed to on-call rotations and incident response, coordinating with devs to restore services under tight SLAs.
- Mentored junior engineers annually in the E-Challenge program, providing workshops, onboarding docs, and hands-on labs.

Client Projects

• Chanel — E-Commerce Platform (Azure)

- Provisioned Azure infrastructure with Terraform and Bicep, creating reusable modules for networking, storage, and compute. Designed secure VNETs, role assignments, and service principals to enforce least-privilege access.
- Built GitLab CI pipelines for build/test/deploy, introducing staged approvals, quality gates, and automated rollback triggers. This reduced deployment failures and gave the client higher confidence in release cycles.
- Containerized and deployed Java/Spring microservices to Kubernetes clusters with autoscaling, health probes, and blue/green rollout strategies. Tuned cluster resources to handle large traffic spikes during global campaigns without downtime.
- Worked closely with Chanel's QA and marketing teams to coordinate cutover windows and validate deployments under load.
- Supported data integration tasks by automating CI/CD workflows that connected application services with Azure Data Factory pipelines and SQL-based reports.

• Nestlé (Nescafé) — E-Commerce Platform (AWS)

- Designed and implemented Terraform modules for AWS VPC, subnets, security groups, IAM roles/policies, and EKS cluster, ensuring repeatable, secure environments.
- Built and tuned logging/metrics pipelines (CloudWatch + ELK), enabling real-time monitoring and reducing mean-time-to-resolution (MTTR) for production incidents.
- Automated non-prod environment shutdown schedules and optimized resource sizes (EC2 instance types, auto-scaling groups), achieving noticeable monthly cost savings.
- Collaborated with Nestlé's dev teams to integrate CI/CD jobs with application testing and deployment pipelines, reducing manual steps and ensuring more reliable releases.
- Provided runbooks and training sessions for client-side engineers to take ownership of day-to-day operations post-handover.

• SQLI Internal DevOps Project

- Deployed Rancher to centrally manage multiple Kubernetes clusters and provide isolated dev/test/stage environments for teams.
- Migrated legacy on-prem VM workloads to Rancher-managed Kubernetes, improving provisioning speed and scalability.
- Developed small PowerShell and Bash scripts for deployment automation, resource provisioning, and configuration tasks in Azure environments.
- Led data migration of app artifacts and databases from local servers to Azure storage and managed databases, with validation and minimal downtime.

- Piloted on-prem → AKS: containerized an internal app, deployed to Azure Kubernetes Service, and integrated with CI/CD.
- Authored Terraform templates to standardize Rancher/AKS setup; trained engineers to adopt the platform.

Cloud & DevOps Engineer-Intern — SQLI, Rabat, Morocco

Mar 2022 – Aug 2022

Successfully completed SQLI's E-Challenge program — a 6-month structured training track. The program started with foundations in backend (Java/Spring basics) and frontend (HTML/CSS/JS), then moved into advanced DevOps practices including Docker, Kubernetes, CI/CD design, and Azure cloud administration. This structured path provided the groundwork before contributing to internal projects such as Harbor/Trivy integration and a GCP deployment.

Key Contributions

- Integrated Harbor + Trivy into CI/CD pipelines, introducing automated image scanning gates. Prevented deployment of containers with high/critical vulnerabilities, which improved security compliance for internal projects and gave engineers clearer feedback on image quality.
- Deployed a demo web application on GCP: configured VPC networking, provisioned Compute Engine VMs, assigned IAM roles, and implemented a lightweight GitLab CI/CD flow. This hands-on project gave practical exposure to multi-cloud deployments and was later used as a training exercise for new cohorts.
- Applied IaC principles by developing Terraform modules and Ansible playbooks in lab environments, reinforcing best practices for repeatable infrastructure builds and reducing setup time during training.
- Authored a “starter guide” documenting the Harbor/Trivy integration and GCP deployment steps. This guide was adopted in the E-Challenge program to onboard new interns more quickly, reducing ramp-up time for future cohorts.
