Location: Lethbridge, AB, Canada

SUMMARY

I am an information technology professional who, before starting my career in IT, worked in administrative roles across various departments, gaining knowledge of multiple business processes and procedures. Upon completing my degree in Information Systems, I transitioned to IT, where I have worked for the past 7 years.

During my time in administrative roles, I acquired general knowledge of controllership and supply chain processes within companies, enhancing my ability to develop solutions related to these operations.

After entering the IT field professionally, I primarily worked as a software engineer, initially focusing on implementing features in existing systems and later on developing new systems. My work spans the entire software development lifecycle, including requirements analysis, architecture, design, project management, coding, testing, hosting environment configuration, user support, and maintenance.

More recently, I have also been working with business intelligence to expand my skills into another critical area of software solutions within organizations—data analysis.

Therefore, my main qualification today is the ability to turn management and/or business ideas into reality through information technology.

SKILLS

Software Engineering, Back-End Development, Front-End Development, Full-Stack Development, API Development, Software Development Lifecycle, Requirements Analysis, Design, Database Modeling, TypeScript, React, Node, Express, CSS, HTML, SQL, PostgreSQL, MongoDB, Redis, CI/CD, GitHub, Docker, Linux, Windows Server, Vercel, Business Intelligence, Qlik Sense, Microsoft Office

EXPERIENCE

Software Engineer

Guararapes · Full Time

Apr 2021 – Present

Palmas, Paraná, Brazil · On-site

- Development of a web-based system for the marketing, commercial, logistics, and administrative departments, responsible for managing requests and approvals for sponsorships, events, and the distribution of materials such as displays and samples. The solution integrated several isolated processes into a single platform, promoting greater operational efficiency and data integrity. The activities I carried out in this project included: requirements analysis, architecture, design, database modeling, full-stack coding, server setup, maintenance, and user support. Technologies used in development: TypeScript,

React (frontend), Node.js (backend), Expo (mobile), and PostgreSQL (DBMS). Backend hosted on Windows Server 2012 and frontend on Vercel.

- Development of a web-based system for managing monthly corporate benefits granted to employees. The system replaced various decentralized methods with a single solution, streamlining operations and increasing data accuracy. The activities I participated in for this project included: requirements analysis, architecture, design, full-stack development, maintenance, and user support. Technologies used: TypeScript, React (frontend), Node.js (backend), and PostgreSQL (DBMS). Backend hosted on a Debian 11 server and frontend on Vercel.
- Development of a robust web-based system for production management and quality control, with a focus on product traceability throughout the entire manufacturing process. This system replaced three legacy systems, providing integrated and new functionalities, data centralization, data integrity, multi-site management, ease of access, integration with other systems, and process automation. The activities I carried out in this project included: requirements analysis, back-end architecture, database modeling, back-end development and server setup. Technologies used: TypeScript, Node.js (backend), and PostgreSQL (DBMS). Backend hosted on a Debian 11 server, using Docker for the database.
- Development of a web-based system for requesting and managing the development of new products, collecting the necessary data and approvals related to the process. This system replaced the manual process previously carried out through spreadsheets and emails. It was developed to be the company's exclusive tool for the mentioned functionalities, bringing benefits such as centralized information, data integrity, and ease of historical data retrieval. The activities I carried out in this project included: requirements analysis, back-end architecture, database modeling, back-end development, server setup and user support. Technologies used: TypeScript, Node.js (backend), PostgreSQL (DBMS), MongoDB (logs), and Redis (cache). Backend hosted on a Debian 11 server, using OCI Docker containers for both SQL and NoSQL databases.
- Development of BI scenarios using Qlik Sense for visualizing industrial indicators.

Software Engineer

RP Info Sistemas · Full Time

Apr 2018 – Mar 2021

Mariópolis, Paraná, Brazil · On-site

- Developed new features and maintained existing ones for a supermarket and fuel station software. Key developments included payment methods, discount rules, barcode validation, CRM features, hardware integration, and more.

Administrative Assistant

Alcast do Brasil S/A · Full Time

Aug 2013 – Mar 2018

Palmas, Paraná, Brazil · On-site

- Performed administrative tasks in logistics, purchasing, sales, and mainly accounting. Responsibilities included delivery control, supplier quotations, invoice entries and checks, purchase order transactions, stock and financial movements, and inventory.

ADDITIONAL INFORMATION

- Full-stack development of a web-based system for dental clinics, with modules for scheduling, patient registration, treatments, quotes, prescriptions, financial management, and inventory. Designed as a SaaS, though it's not in production. Technologies used: TypeScript, Node.js (backend), PostgreSQL (DBMS).
- Website development using Next.js.
- Website development using React.
- Website development using HTML and CSS only.
- Development of a software for restaurants as capstone project for my Bachelor's Degree. Technologies used: Java EE, Hibernate and JSF.

EDUCATION

Instituto Federal do Paraná

Bachelor's Degree in Information Systems
2014 - 2017

LANGUAGES

- **English** – Native
- **Portuguese** – Native
