Result driven Backend Software Developer with 3+ years of professional experience designing, building and operating scalable, production grade backend systems. Strong background in Go and Python, RESTful API design, and distributed systems. Hands on experience modernizing legacy platforms, modeling complex system dependencies and supporting secure, high availability SaaS products. Adept at collaborating across engineering, QA, DevOps, and product teams to deliver reliable, maintainable, and security conscious software.

SKILLS AND QUALIFICATIONS

Languages: Go (primary), Python, TypeScript/JavaScript, Java, C/C++.

Backend & Systems Engineering: RESTful API design (JSON). PostgreSQL integration. Dependency-aware system design, microservices and distributed systems. Async job processing, stateless authentication (JWT). Linux-based development environments.

Data & Infrastructure: CI/CD pipelines and automated builds. Production observability, monitoring and logging. Analytics and data processing pipelines.

Engineering Practices: clean, well-tested code. API contract stability, code reviews and technical documentation. Agile development.

Work Experience

Software Developer, WISI America – Pitt Meadows BC

May 2022 – September 2026

- Designed, implemented, and deployed production grade Go microservices to replace legacy backend APIs, improving scalability, reliability and maintainability.
- Led the design of RESTful APIs consumed by fronted applications, emphasizing stable contracts, secure authentication, and backward compatibility across evolving systems.
- Modeled and evolved backend systems with multiple inter-service dependencies, ensuring predictable behavior as features and integrations scaled.
- Collaborated cross-functionally with product managers, QA, DevOps, and frontend developers to deliver features from beta through production.
- Contributed to CI/CD pipelines, sprint planning, code reviews, and technical documentation to support transparency, reproducibility, and long-term system health.

QA Engineer, BC Transit- Victoria BC

May 2021 – Dec 2021

- Developed automated testing frameworks and performance test suites integrated into CI pipelines, increasing release confidence and reducing regressions.
- Designed and deployed reliability, performance, and observability checks using Jenkins to proactively identify system-level risks.
- Partnered closely with developers to embed quality standards and testing practices early in the development cycle.
- Hands-on experience debugging complex system failures across build, test, and deployment stages.

EDUCATION

Bachelor of Software Engineering, University of Victoria, Victoria BC

Sept 2017 – December 2022

- Focused research on neural networks for network anomaly detection, emphasizing large-scale data preprocessing, system optimization, and pipeline reliability.
- Applied concepts for graph-based modeling, numerical analysis, and performance tuning to real-world system analysis problems.

LICENSES AND CERTIFICATIONS

Professional Engineer (EIT), Engineers and Geoscientists BC – Burnaby BC

Expected Completion: May 2026

- Actively progressing toward Professional Engineer (P.Eng) designation.
- Demonstrates commitment to ethical engineering practice, system correctness, and professional accountability in software development.

PROJECTS

Backend API Migration & Dependency Stability

Managing Build and Runtime Constrains Across Architectures

As part of my role at WISI America

- Led the migration of a legacy PHP backend to Go-based services, maintaining strict backward compatibility and ensuring zero breaking changes for downstream consumers.
- Designed RESTful endpoints with table schemas and predictable semantics, treating APIs as long-lived system contracts within a growing service ecosystem.
- Coordinated with senior engineers and international stakeholders to align backend changes with frontend dependencies, resolving cross-system issues under production constraints.

JWT Based Stateless Authentication System

Security-oriented Backend Refactor for Scalable APIs

As part of my role at WISI America

- Designed, implemented, and tested a stateless JWT authentication mechanism to replace legacy Basic Authentication across services.
- Collaborated closely with frontend engineers and DevOps to coordinate secure, multi-environment roll out without service disruption.
- Emphasized stateless design, security boundaries, and scalability, aligning authentication with distributed, dependency-aware backend architecture.

Quality Assurance Initiative with System Analytics and Automation Using Python

As part of my role at BC Transit

- Pioneered a QA initiative to improve system reliability, introducing automated testing frameworks, advanced logging and observability tools to track mean time between failures (MTBF).
- Designed modular pipelines for collecting and analyzing QA metrics-experience transferable to ML pipeline monitoring and data pre-processing.
- Collaborated with stakeholders across engineering, design and product teams to define QA requirements, align on performance thresholds, and ensure long-term product health.
