EDUCATION

Simon Fraser University

Bachelor of Science in Computer Science

Burnaby, Canada

September 2020 – September 2025

TECHNICAL SKILLS

Languages: Java, Python, C/C++, JavaScript, Typescript HTML/CSS, SQL, Ruby, Kotlin

Frameworks: React, Angular, Node.js, Swing, Spring Boot, Dagger, Catch, Ruby on Rails

Developer Tools: Git, VS Code, IntelliJ, AWS, Docker, Buildkite, Shipit, Datadog, Looker, ServiceNow, CDK

Operating Systems: Linux, Windows, macOS, Android

PROFESSIONAL EXPERIENCE

Software Development Engineer Intern

July 2025 – September 2025

AWS CloudWatch

Vancouver, Canada

- Designed, implemented, and deployed an AI-powered service that enables customers to automatically generate Log Transformers through natural language prompts in the AWS CloudWatch Logs Console.
- Built a fully scalable Lambda backend with dynamoDB concurrency throttling, ARPS authentication, input sanitization, transformer validation, context-aware session retrieval, and exponential retry mechanisms.
- Created a fully extendable Knowledge Base through S3 and custom vector store in OpenSearch to provide the Bedrock LLM with domain-specific CloudWatch Logs documentation. Introduced automated Knowledge Base ingestion and synchronization through CDK for continuous updates of Transformer templates.
- Integrated the service into the CloudWatch Console frontend by creating a new API, internal hosted domain with DNS infra, SDK client, and console components, while collaborating with multiple away teams.
- Implemented comprehensive logging, debugging tools, exception handling, and observability dashboard with 20+ metrics for easy long-term maintenance of the service.

Software Development Engineer Intern

January 2025 – June 2025

SAP Canada Inc.

Vancouver, Canada

- Built a fullstack web service with angular and java spring that fetches the description and download url of software components, owning the entire architecture, implementation, and deployment of the service.
- Optimized our team's FIPC service (software component risk analyzer) by introducing a database caching layer for aggregation results, reducing redundant API calls and improving speed by over 300 percent.
- Designed and developed a system for analysts to manually add risk ratings to software components in FIPC Service, alongside creating official design documents, diagrams, and leading team meetings for this feature.
- Implemented fullstack authentication in FIPC service by creating a certificate-base token microservice and then integrating token-based access control in the frontend.
- Resolved 10+ critical bugs and closed 10+ other miscellaneous issues.

Production/DevOps Engineer Intern

May 2022 – December 2022

Clio — Cloud-Based Legal Technology

Burnaby, Canada

- Participated in the establishment of a new Production Engineer Team by assisting in the development of official documentation, tech stack, mission goals, workflow, and also supporting the onboarding of 3 new team members.
- Developed an automated program that extracts various production metrics from Clio apps. Integrated the program into Clio's infrastructure so it sends these metrics to Datadog through a Shipit pipeline. Highlighted various development bottlenecks that existed which lead to a 50% increase in productivity.
- Created a database through AWS and connected it to Looker. Updated my Data Harvesting Program so it runs on a Buildkite agent in a Kubernetes Cluster, sending its data to the new AWS database. Increased the retention of Historical Data Logs from 15 months to indefinitely by making this shift.
- Migrated Clio's Tier One Application and Integration Tests from executing directly on Buildkite agents to executing inside containers on the CI build pipeline.
- Identified a common pain-point in Clio's ecosystem and created a software tool to automate the creation of new ruby on rail microservices, inline with Clio specific configurations.
