Calgary, Canada

PROFESSIONAL SUMMARY

I am a Senior Software Engineer with over 7 years professional experience with a strong focus on security-driven architecture, cloud integration, delivering resilient and scalable solutions for enterprise and start-up environments. I have a proven track record in leading complex technical projects, optimising processes to enhance efficiency, and driving strategic initiatives from concept to deployment. Furthermore, I am fluent in multiple programming languages, enabling versatile problem-solving across diverse technology stacks and recognised for exceptional communication skills that simplify intricate technical concepts, fostering collaboration and boosting team productivity. I remain committed to leveraging advanced security principles and cloud technologies to ensure robust, future-ready systems.

SKILLS

C#, Java, Python, JavaScript, React.js, TypeScript, NodeJS, .NET Core, Spring Framework, Django/Flask, SQL, NoSQL, KQL, Postgres, Oracle, MongoDB, Azure, AWS, REST API, GraphQL, TDD, DDD, Git, Jenkins, CI/CD, Redis, RabbitMQ, Kubernetes, Docker, Microservices, System Architecture & Design, Leadership, Effective Communication, Project Management, Collaboration, Process Optimisation, Self-motivated, Creative, Great Presentation Skills and User-Centered Design.

EXPERIENCE

Senior Software Engineer, Microsoft, Tallinn, Estonia

06/2021 - Present

- Managed the development of a real-time data validation platform to detect EU Data Boundary violations, ensuring compliance with geographic data residency commitments. Expanded data coverage from 1.7% to 5% by integrating additional data sources, with ongoing efforts targeting 100% coverage. Implemented using Azure Synapse Pipelines and Spark Jobs to construct dynamic Service & Resource Graphs.
- Led the fortification of our Services against cyber threats by redesigning our service architecture to isolate these services from the Public Internet where access is only allowed through Azure Front Door and communication between services and downstream dependencies going through Private Endpoints and Virtual Networks. This redesign led to 99% drop in outside traffic getting to our service.
- Developed a C# .NET Core service paired with Azure Data Factory to track deployments and health of all applications deployed across specific cloud environments enabling SREs and other 3rd party vendors to centrally manage and view the state of all deployed cloud services in an efficient and compliant manner.
- Enforced service monitoring using custom internal monitoring tools to collect, store, and analyze service metrics in near-real-time. Additionally, configured intelligent alerting using monitors to detect unhealthy services while enhancing these alerts to get all the required diagnostic information with automatic incident response to initiate actions once a monitor evaluates as unhealthy.

Software Engineer, Swedbank AS, Tallinn, Estonia

09/2018 - 05/2021

- Implemented a service for Regulatory and Compliance Reporting using Java Spring MVC with MongoDB data store. This service interacts with various services and data sources to retrieve the data, apply data transformation rules and make the reports available to regulators. This service ensures that the bank stays in compliance with regulatory requirements.
- Interacted with Business leads to gather requirements for the improvements of the distributed system for Financial Securities execution and contributed to the architectural and technical design documents. Also, implemented and maintained the Bond Order section on the Internet Bank which allows the user to view, compare and create Bond Orders while constantly analyzing users' usage for insights.
- Designed and developed a Bond Order Emulator service with Spring Boot, Oracle database and ReactJS deployed to Docker container. The Emulator connects to the NASDAQ Data Feed for real-time Securities Exchange information and allows the user to simulate order conditions like Bid/Ask prices, place, match and execute orders. This emulator cut down development time by allowing the team and business persons to stimulate various order situations before actual development.

EXPERIENCE

Cofounder/Software Engineer, Greentickets OU, Tartu, Estonia

09/2017 - 08/2018

Co-founded a technology company and led the technical team to implement solutions for multi-modal travel.

- Managed a development team of five (5) to develop a travel platform solving the problem of multi-modal travel within the Baltics Region using Java Spring Boot to implement the Travel Aggregator and Python Django to implement the Booking Service with both services deployed to Kubernetes Cluster.
- Responsible for driving the technical implementation of the multi-modal travel solutions while coordinating with sales and business leads to make sure that the solution meets the needs of the target market.
- Directed discussions with technical partners on service integration including driving brainstorming sessions to create architectural and technical design documents.

EDUCATION

M.Sc. in Software Engineering

University of Tartu

08/2016 - 08/2019 Tartu, Estonia

B.Sc. in Computer Engineering and Technology

Volgograd State Technical University

09/2011 - 07/2015 Volgograd, Russia

iOS Development (Masters Class)

Apple Developer Academy

10/2017 - 06/2018 Napoli, Italy

LANGUAGES

English

Native

Russian

Advanced
