EXPERIENCE

Senior Software Engineer | Amazon Services LLC, Seattle, WA

Jan 2023 – Present

- Automated Requisition Creation
 - Led the development of an automation feature for recruitment requisition creation on an AWS-based application. Enhanced API with new fields using Java and React (TypeScript) to support auto-requisitions, resulting in the automation of 80% of requests and generating over 18,000 requisitions.
- CSV based hiring demand ingestion
 - Designed and integrated a CSV ingestion feature into the existing user interface for streamlined recruitment demand submission. This improved usability for non-technical users, increasing adoption by 30%.
- Hiring Demand submission optimization
 - Spearheaded the optimization of the recruitment submission workflow by eliminating redundant steps. Reduced the total recruitment lifecycle by 1 business day per requisition and saved 1,000+ hours annually for the recruiting team.
- Creating a full CD pipeline for Data Extenders
 - Architected and implemented a full continuous delivery pipeline with 100% test coverage for product pipelines. Established robust end-to-end testing, ensuring high reliability across all service functionality.
- Framework for data migration
 - Devised and executed a data migration strategy to transfer 3 million+ records from a legacy recruitment software to AWS DynamoDB, completing the migration within 3 hours with zero data loss.

Software Engineer | Cisco Systems, Cloud Security, San Jose, CA

Nov 2017 – Jan 2023

- Cross-Origin Block Page Functionality
 - Developed and implemented a solution to display accurate block pages for customers in multi-org environments, enhancing user experience and reducing customer confusion.
- Block Page Service on AWS EC2
 - Scoped and implemented a prototype for a block page service on AWS EC2, leading cross-functional collaboration to ensure seamless delivery of service components. Defined project scope, estimated efforts, and managed multi-quarter deliverables.
- Containerization of Bare Metal Services
 - Led the design and implementation of containerizing the Greylist management service, transitioning from a bare metal setup. Achieved this with zero downtime, improving service scalability and maintainability.
- Traffic Visualization Dashboard
 - Defined critical service metrics and developed a comprehensive traffic visualization dashboard using Grafana. Enhanced real-time monitoring for the block page service.
- Service Alerting Overhaul: Planned and executed the migration from Mailgun to AWS SES for email alerts across 10+ microservices, collaborating with a small team. Improved system reliability and reduced alerting costs.
- Load Balancer Health Monitoring: Designed and implemented a service to monitor the health of Secure Web Gateway load balancer containers, mitigating customer impact during service disruptions and ensuring higher availability.
- Centralized Logging Framework: Implemented a centralized logging framework using Vector across 50+ servers, sending security logs to AWS Firehose for real-time security scanning, improving the speed and accuracy of threat detection.

TECHNICAL SKILLS

- **Programming Languages:** Java, Kotlin, Python, TypeScript, React, Shell scripting
- **Technologies:** Docker, Linux/Unix, Shell Scripting, Terraform, Ansible, Datadog, Nagios, Grafana, Pagerduty, GitHub CI/CD, Jira, Prometheus, Ms365 Office, Prompt Engineering
- **Cloud Platforms & Data Management:** AWS, GCP, SQL, NoSQL

EDUCATION

Master of Science in Computer Science

San Jose State University, San Jose, CA
